Published online 20.09.2019

## ABSTRACT

With use of original Bohr model, corrected in accordance with Archimedes and Ampere laws, was obtained forgotten Bohr formula, which was found to be consistent with experimental data.

## ORIGINAL BOHR MODEL OF HYDROGEN ATOM

In accordance with Coulomb law, attraction force between proton and electron is

$$
\begin{equation*}
\mathrm{F}_{\text {colomb }}, \mathrm{N}=\left\{\mathrm{c}^{2} / 10^{7}\right\} \mathrm{e}^{2} / \mathrm{r}_{\mathrm{e}}^{2} \tag{1}
\end{equation*}
$$

Here $\mathrm{c}=299792458 \mathrm{~m} / \mathrm{s}$ is speed of light in vacuum, $\mathrm{e}=1.6021766208 \times 10^{-19}$ Coulombs is elementary charge, $r_{e}$ is radius of electron orbit. Centrifugal force is given by:
$\mathrm{F}_{\text {centrifugal }}, \mathrm{N}=\mathrm{m}_{\mathrm{e}} \mathrm{v}_{\mathrm{e}}{ }^{2} / \mathrm{r}_{\mathrm{e}}$
From equality $\mathrm{F}_{\text {colomb }}=\mathrm{F}_{\text {centrifugal }}$, there is relation:
$m_{e} v_{e}^{2}=\left\{c^{2} / 10^{7}\right\} e^{2} / r_{e}$
(3) or
$2 \mathrm{E}_{\text {kin }}=\mathrm{E}_{\text {colomb }}$
From this relation, orbital velocity of electron is defined by:
$\mathrm{v}_{\mathrm{e}}=\left\{\mathrm{c}^{2} / 10^{7}\right\} \mathrm{e}^{2} / \mathrm{r}_{\mathrm{e}} \mathrm{m}_{\mathrm{e}} \mathrm{V}_{\mathrm{e}}$
Bohr assumed equality:
$n \hbar=r_{e} m_{e} V_{e}$
Here n is level number.
With this guess, orbital velocity of electron at n level is
$\mathrm{v}_{\mathrm{en}}=\left\{\mathrm{c}^{2} / 10^{7}\right\} \mathrm{e}^{2} / \mathrm{n} \mathrm{\hbar}=[2187691.262716 \mathrm{~m} / \mathrm{s}] / \mathrm{n}$
Fine structure constant is then
$\alpha=\mathrm{v}_{\mathrm{e} 1} / \mathrm{c}=\left\{\mathrm{c} / 10^{7}\right\} \mathrm{e}^{2} / \hbar=1 / 137.03599914 \ldots=0.0072973525662 \ldots$
Here $\mathrm{v}_{\mathrm{e} 1}$ is velocity of electron at $1^{\text {st }}$ level.

Radius or circular trajectory of electron is:
$\mathrm{r}_{\mathrm{en}}=\left\{\mathrm{c}^{2} / 10^{7}\right\} \mathrm{e}^{2} / \mathrm{m}_{\mathrm{e}} \mathrm{v}_{\mathrm{e}}{ }^{2}=\mathrm{n} \mathrm{\hbar} / \mathrm{m}_{\mathrm{e}} \mathrm{v}_{\mathrm{e}}=\left[\begin{array}{ll}0.529177210564 \ldots \AA] \mathrm{n}^{2}\end{array}\right.$
From Eq (4), binding energy at $1^{\text {st }}$ level E1 $=\left(\mathrm{E}_{\text {coulomb }}-\mathrm{E}_{\text {ekin }}\right)=\mathrm{E}_{\text {ekin }}$ :
$\mathrm{E} 1=\mathrm{E}_{\text {coulomb }}-\mathrm{E}_{\text {kin }}=0.5 \mathrm{E}_{\text {coulomb }}=\mathrm{E}_{\text {ekin }}=\mathrm{m}_{\mathrm{e}} \mathrm{v}_{\mathrm{e}}^{2} / 2=2.17987232539 \times 10^{-18} \mathrm{~J}$
Binding energies at higher levels:
$\mathrm{E}_{\mathrm{n}}=\mathrm{E} 1 / \mathrm{n}^{2}$
Lines of ionization from n level (in vacuum):
$\lambda(n-\infty)=c h / E_{n}=[911.26705038385 \AA]^{2}$
Corresponding frequencies are:
$\mathcal{V}(\mathrm{n}-\infty)=\mathrm{c} / \lambda(\mathrm{n}-\infty)=\mathrm{E}_{\mathrm{n}} / \mathrm{h}=\left[3.289841961 * 10^{15} \mathrm{~Hz}\right] / \mathrm{n}^{2}$
Specific frequency of hydrogen atom (number of electron rotations per second $=\mathrm{Hz}$ ) is:
$\mathcal{V}_{\mathrm{At}}=\left\{\mathrm{v}_{\mathrm{e}} / 2 \pi \mathrm{r}_{\mathrm{e}}\right\}=\left[6.579683922 * 10^{15} \mathrm{~Hz}\right] / \mathrm{n}^{3}$
Interestingly, that resonance between atom and light arises at $\mathcal{V}_{\text {light }}(\mathrm{n}-\infty)=0.5 \mathrm{n} \mathcal{V}_{\text {Atn }}$, i.e. at $\mathcal{V}(1-\infty)=0.5 \mathcal{V}_{\mathrm{At}, \mathrm{n1} 1}$, at $\mathcal{V}(2-\infty)=\mathcal{V}_{\mathrm{At}, \mathrm{n2}}$, at $\mathcal{V}(3-\infty)=1.5 \mathcal{V}_{\mathrm{At}, \mathrm{n3}}$, at $\mathcal{V}(4-\infty)=2 \mathcal{V}_{\mathrm{At}, \mathrm{n} 4}$, etc.

Frequency of translation between levels is defined by
$\mathcal{V}\left(\mathrm{n}_{1}-\mathrm{n}_{2}\right)=\mathcal{V}\left(\mathrm{n}_{1}-\infty\right)-\mathcal{V}\left(\mathrm{n}_{2}-\infty\right)=\left[3.289841961 * 10^{15} \mathrm{~Hz}\right]\left\{1 / \mathrm{n}_{1}^{2}-1 / \mathrm{n}_{2}^{2}\right\}$
Wavelengths of spectral lines (in vacuum) may be then calculated from:
$\lambda\left(\mathrm{n}_{1}-\mathrm{n}_{2}\right)=\mathrm{ch} /\left(\mathrm{E}_{\mathrm{n} 1}-\mathrm{E}_{\mathrm{n} 2}\right)=[911.26705038385 \AA] /\left\{1 / \mathrm{n}_{1}{ }^{2}-1 / \mathrm{n}_{2}{ }^{2}\right\}$
Here $1 / \mathrm{R}_{\mathrm{H}}=911.26705038385 \AA$ is reversed Rydberg constant. As may be seen in Tab 2, within $\sim 0.0535 \%$, original Bohr model is consistent with measurements.

Tab 1 Fundamental constants (Mohr et al 2016)

| Speed of light, c | $299792458 \mathrm{~m} / \mathrm{s}$ |
| :--- | :--- |
| Plank constant, h | $6.62607004 \times 10^{-34} \mathrm{~J} \times \mathrm{s}$ |
| Reduced Plank constant, $\mathrm{\hbar}=\mathrm{h} / 2 \pi$ | $1.0545718 \times 10^{-34} \mathrm{~J} \times \mathrm{s}$ |
| Fine structure constant, $\alpha$ | $1 / 137.03599914$ |
| Elementary charge, e | $1.6021766208 \times 10^{-19} \mathrm{C}$ |
| Mass of electron, $\mathrm{m}_{\mathrm{e}}$ | $0.000910938356 \times 10^{-27} \mathrm{~kg}$ |
| Mass of proton, $\mathrm{m}_{\mathrm{p}}$ | $1.672621898 \times 10^{-27} \mathrm{~kg}$ |
| Ratio $\mathrm{m}_{\mathrm{p}} / \mathrm{m}_{\mathrm{e}}$ | 1836.152674 |
| Ratio $\mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}$ | 0.0005446170214 |
| Rydberg constant, $\mathrm{R}_{\mathrm{i}}$ | $10973731.568539 \mathrm{~m}^{-1}$ |
| Rydberg constant of ${ }^{1} \mathrm{H}, \mathrm{R}_{\mathrm{H}}=\mathrm{R}_{\mathrm{i}} /\left(1+\mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}\right)$ | $10967758.34 \mathrm{~m}^{-1}$ |

Tab 2 Wavelengths of Spectral lines of Hydrogen atom in vacuum and prediction from Bohr model, and that multiplied by $\left(1+\mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}\right)$.

| Translation | Compilation of experimental data from Kramida $(2010)^{\mathrm{a}}$ | Bohr model wavelengths, $\AA$ (Eq 16) | Error, observed minus calculated, \% | Bohr model wavelengths, $\AA$ multiplied by $\left(1+\mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}\right)$ (Eq 17) | Error, observed minus calculated, \% |

a: data from Tab. 10 and 11 in Kramida (2010), initially presented in the inversed centimeters, mostly with 7 digits.
b: averaged values, calculated from experimental data (this study).

As may be seen, deviation of original Bohr model from data is close to electron-to-proton mass ratio. Thus, multiplying wavelengths from original Bohr model by "adjusting factor" ( $1+\mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}$ ), one may obtain much closer result (see last columns in Tab. 2):

$$
\begin{align*}
\lambda(\mathrm{n} 1-\mathrm{n} 2) & =[911.26705038385 \AA]\left(1+\mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}\right) /\left\{1 / \mathrm{n}_{1}{ }^{2}-1 / \mathrm{n}_{2}{ }^{2}\right\}= \\
& =[911.76334193052 \AA] /\left\{1 / \mathrm{n}_{1}^{2}-1 / \mathrm{n}_{2}{ }^{2}\right\}=\left\{1 / \mathrm{R}_{\mathrm{H}}\right\} /\left\{1 / \mathrm{n}_{1}{ }^{2}-1 / \mathrm{n}_{2}{ }^{2}\right\} \tag{17}
\end{align*}
$$

Here $1 / R_{H}=911.76334193052 \AA$ is reversed Rydberg constant for ${ }^{1} \mathrm{H}$. Let us consider the origin of "adjusting factor" $\left(1+\mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}\right)$.

## BOHR MODEL WITH ROTATING PROTON

At the movement of electron and proton around the barycenter, the Archimedes law of lever should be satisfied:
$\left|\mathrm{v}_{\mathrm{p}} / \mathrm{v}_{\mathrm{e}}\right|=\mathrm{r}_{\mathrm{p}} / \mathrm{r}_{\mathrm{e}}=\mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}$
From Eq (18), radius of proton orbit and its orbital velocity may be found from:
$\mathrm{r}_{\mathrm{p}}=\mathrm{r}_{\mathrm{e}} \mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}$
$\left|\mathrm{v}_{\mathrm{p}}\right|=\left|\mathrm{v}_{\mathrm{e}}\right| \mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}$
Note here that velocities of proton and electron are always opposite (see Fig 1).

Fig. 1 Idealized orbit of Sun (neglecting tags from all planets except Jupiter). Balance between Coulomb and centrifugal tags should be rewritten as:

$$
\begin{equation*}
m_{e} v_{e}^{2} / r_{e}=m_{p} v_{p}^{2} / r_{p}=\left\{c^{2} / 10^{7}\right\} e^{2} /\left(r_{e}+r_{p}\right)^{2} \tag{21}
\end{equation*}
$$

This relation may be transformed to:
$\left(1+m_{e} / m_{p}\right) * m_{e} v_{e}{ }^{2} /\left(r_{e}+r_{p}\right)=\left(1+m_{p} / m_{e}\right) * m_{p} v_{p}{ }^{2} /\left(r_{e}+r_{p}\right)=\left\{c^{2} / 10^{7}\right\} e^{2} /\left(r_{e}+r_{p}\right)^{2}$
$\left(1+m_{e} / m_{p}\right) * m_{e} \mathrm{v}_{\mathrm{e}}{ }^{2}=\left(1+\mathrm{m}_{\mathrm{p}} / \mathrm{m}_{\mathrm{e}}\right) * \mathrm{~m}_{\mathrm{p}} \mathrm{v}_{\mathrm{p}}{ }^{2}=\left\{\mathrm{c}^{2} / 10^{7}\right\} \mathrm{e}^{2} /\left(\mathrm{r}_{\mathrm{e}}+\mathrm{r}_{\mathrm{p}}\right)$
Thus, orbital velocities of electron and proton are
$v_{e}=\left\{c^{2} / 10^{7}\right\} e^{2} /\left\{\left(\mathrm{r}_{\mathrm{e}}+\mathrm{r}_{\mathrm{p}}\right) \mathrm{m}_{\mathrm{e}} \mathrm{v}_{\mathrm{e}}\right\} /\left(1+\mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}\right)$
$\mathrm{v}_{\mathrm{p}}=\left\{\mathrm{c}^{2} / 10^{7}\right\} \mathrm{e}^{2} /\left\{\left(\mathrm{r}_{\mathrm{e}}+\mathrm{r}_{\mathrm{p}}\right) \mathrm{m}_{\mathrm{p}} \mathrm{v}_{\mathrm{p}}\right\} /\left(1+\mathrm{m}_{\mathrm{p}} / \mathrm{m}_{\mathrm{e}}\right)=\mathrm{v}_{\mathrm{e}} \mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}$
Since equality $n \hbar=m_{e} v_{e} r_{e} \approx 1836 \times m_{p} v_{p} r_{p}$ seems to be doubtful, let as assume the following relation:
$n \hbar=\left(r_{e}+r_{p}\right) \times m_{e} \times v_{e}=\left(r_{e}+r_{p}\right) \times m_{p} \times v_{p}$
Note here that $\left(r_{e}+r_{p}\right)$ is distance between electron and proton, like in Eq (6).
Thus, orbital velocities of electron and proton may be calculated from:
$\mathrm{v}_{\mathrm{e}}=\left\{\mathrm{c}^{2} / 10^{7}\right\} \mathrm{e}^{2} /\left\{\mathrm{n} \mathrm{\hbar}\left(1+\mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}\right)\right\}=[2186500.457349 \mathrm{~m} / \mathrm{s}] / \mathrm{n}$
$\mathrm{v}_{\mathrm{p}}=\left\{\mathrm{c}^{2} / 10^{7}\right\} \mathrm{e}^{2} /\left\{\mathrm{n} \mathrm{\hbar}\left(1+\mathrm{m}_{\mathrm{p}} / \mathrm{m}_{\mathrm{e}}\right)\right\}=\mathrm{v}_{\mathrm{e}} \mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}=[1190.805366 \mathrm{~m} / \mathrm{s}] / \mathrm{n}$
Orbital radii may be then calculated from
$\mathrm{r}_{\mathrm{e}}+\mathrm{r}_{\mathrm{p}}=\mathrm{n} \mathrm{\hbar} / \mathrm{m}_{\mathrm{e}} \mathrm{v}_{\mathrm{e}}=\mathrm{n} / \mathrm{m}_{\mathrm{p}} \mathrm{v}_{\mathrm{p}}=\left[\begin{array}{ll}0.52946540948 \AA] \mathrm{n}^{2}\end{array}\right.$
$\mathrm{r}_{\mathrm{e}}=\left(\mathrm{r}_{\mathrm{e}}+\mathrm{r}_{\mathrm{p}}\right) /\left(1+\mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}\right)=\left[\begin{array}{ll}0.52917721056 \AA\end{array} \mathrm{n}^{2}\right.$
$r_{p}=\left(r_{e}+r_{p}\right) /\left(1+m_{p} / m_{e}\right)=r_{e} m_{e} / m_{p}=[0.00028819892 \AA] n^{2}$
Kinetic energies of electron and proton are:
$\mathrm{E}_{\mathrm{e}-\mathrm{kin}}=\mathrm{m}_{\mathrm{e}} \mathrm{v}_{\mathrm{e}}{ }^{2} / 2=\left[2.1774998725^{*} 10^{-18} \mathrm{~J}\right] / \mathrm{n}^{2}$
$\mathrm{E}_{\mathrm{p} \text {-kin }}=\mathrm{m}_{\mathrm{p}} \mathrm{v}_{\mathrm{p}}^{2} / 2=\left\{\mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}\right\} \mathrm{E}_{\text {ekin }}=\left[0.0011859035 * 10^{-18} \mathrm{~J}\right] / \mathrm{n}^{2}$
Thus, total kinetic energy is:
$\mathrm{E}_{\text {kin }}=\mathrm{E}_{\text {ekin }}+\mathrm{E}_{\text {pkin }}=\mathrm{E}_{\text {ekin }}\left(1+\mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}\right)=\mathrm{E}_{\text {pkin }}\left(1+\mathrm{m}_{\mathrm{p}} / \mathrm{m}_{\mathrm{e}}\right)=\left[2.178685776 * 10^{-18} \mathrm{~J}\right] / \mathrm{n}^{2}$
Coulomb energy is

$$
\begin{align*}
& \mathrm{E}_{\text {Coulomb }}=\left\{\mathrm{c}^{2} / 10^{7}\right\} \mathrm{e}^{2} /\left(\mathrm{r}_{\mathrm{e}}+\mathrm{r}_{\mathrm{p}}\right)=\left\{\mathrm{c}^{2} / 10^{7}\right\} \mathrm{e}^{2} \mathrm{~m}_{\mathrm{e}} \mathrm{v}_{\mathrm{e}} / \mathrm{n} \hbar=\left\{\mathrm{c}^{2} / 10^{7}\right\} \mathrm{e}^{2} \mathrm{~m}_{\mathrm{p}} \mathrm{v}_{\mathrm{p}} / n \hbar= \\
&= {\left[4.357371552 * 10^{-18} \mathrm{~J}\right] / \mathrm{n}^{2} } \tag{35}
\end{align*}
$$

Thus, binding energy at $1^{\text {st }}$ level is:
$\mathrm{E} 1=\mathrm{E}_{\text {Coulomb }}-\mathrm{E}_{\text {ekin }}-\mathrm{E}_{\text {pkin }}=0.5 \mathrm{E}_{\text {Coulomb }}=\mathrm{E}_{\text {kin }}=2.178685776 * 10^{-18} \mathrm{~J}$
Thus, wavelengths may be calculated
$\lambda(1-\infty)=\mathrm{ch} / \mathrm{E} 1=1 / \mathrm{R}_{\mathrm{H}}=911.76334193052 \AA$
$\lambda(n-\infty)=(c h / E 1) n^{2}=\left[\begin{array}{ll}911.76334193052 \AA] n^{2}\end{array}\right.$
$\lambda\left(n_{1}-n_{2}\right)=\left[\begin{array}{ll}911.763 & 34193052 \AA\end{array}\right] /\left(1 / n_{1}{ }^{2}-1 / n_{2}{ }^{2}\right)$
As may be seen, wavelengths from Bohr model with rotating proton (Eq 39) are equal to original Bohr model wavelengths, multiplied by the factor ( $1+\mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}$ ), Eq (17).

However there is systematic overestimation by $\sim 0.001 \%$ (see Tab 2). Thus, multiplying Eq (39) by factor $1 / 1.00001$, one may obtain almost exact fit to data. So, let us consider the origin of "adjusting factor" $\sim 1 / 1.00001$.

## AMPERE LAW AND THEORY OF RELATIVITY

In accordance with Ampere law, magnetic force between element of electric current and parallel infinite current is defined by (see Fig 2):
$\mathrm{F} / \Delta \mathrm{L}_{1}, \mathrm{~N} / \mathrm{m}=\left(1 / 10^{7}\right) * 2 \mathrm{I}_{1} \mathrm{I}_{2} / \mathrm{r} \quad\left(\right.$ at $\left.\mathrm{I}_{1} \| \mathrm{I}_{2} \perp_{\mathrm{r}}\right)$

Wire with electric current $\mathrm{I}_{1}=1 \mathrm{~A}$ and its length $\Delta \mathrm{L}=1 \mathrm{~m}$ interacts with parallel infinite electric current $\mathrm{I}_{2}=1 \mathrm{~A}$, located at dictance $\mathrm{r}=1 \mathrm{~m}$, with force $\mathrm{F}=2 * 10^{-7} \mathrm{~N}$. This is attraction if currents flow in the same direction, and it is repulsion if currents flow in opposite directions.

From this relation, one may guess differential Ampere law for parallel elements of current, located on perpendicular to both currents:

$$
\begin{equation*}
\mathrm{F}, \mathrm{~N}=\left(1 / 10^{7}\right) *\left(\mathrm{I}_{1} \mathrm{dL}_{1}\right) *\left(\mathrm{I}_{2} \mathrm{dL}_{2}\right) / \mathrm{r}^{2} \quad\left(\text { valid at } \mathrm{I}_{1} \| \mathrm{I}_{2} \perp \mathrm{r}, \text { and } \mathrm{dL}_{1}, \mathrm{dL}_{2} \ll \mathrm{r}\right) \tag{41}
\end{equation*}
$$

Original Amper law (Eq. 40), may be obtained via integration of tags from elements of currents in parallel and infinite wire with electric current $\mathrm{I}_{2}$.

$$
\begin{array}{rl}
\mathrm{F}, \mathrm{~N}=\left(1 / 10^{7}\right) *\left(\mathrm{I}_{1} \mathrm{dL}_{1}\right) & \begin{array}{l}
\mathrm{L}=\infty \\
2 \int_{\mathrm{L}}\left(\mathrm{I}_{2} \mathrm{dL}\right) \\
\\
\mathrm{L}=0
\end{array} \\
=\left(1 / 10^{7}\right) * 2\left(\mathrm{I}_{1} \mathrm{dL}_{1}\right) * \mathrm{I}_{2} / \mathrm{r} & \mathrm{~L}=\infty \\
& \\
2 \int_{\mathrm{L}=0}^{2}\left(\mathrm{I}_{2} \mathrm{dL}\right) \mathrm{r} /\left(\mathrm{r}^{2}+\mathrm{L}^{2}\right)^{1.5} \tag{42}
\end{array}=
$$

Factor 2 arises here dew to integration from $L=0$ to $+\infty$, and from $L=0$ to $\infty, \sin (\alpha)=r /\left(r^{2}+L^{2}\right)^{0.5}$ is sinus of angle between distance and perpendicular to wires (see Fig 2). Resulting tags are just projections of "hypothetic total tag" onto perpendicular to wires. So, Eq. $(38=$ 39) is sum of tags, orthogonal to wires with current. In classic approach, magnet tag is always orthogonal to velocity of electrons, whereas parallel tags simply do not exist (see Fig. 2). Even if they exist, parallel tags from "upper" element B and "lower" element $C$ of infinite current $I_{2}$ eliminate each over. So, let us follow

Fig. 2 Scheme of interaction between element of current $I_{1}(A)$ and element of infinite current $I_{2}(B)$. the classic approach.

Element of current IdL may be represented by:
IdL, Coulomb $* \mathrm{~m} / \mathrm{s}=\left[\mathrm{e} * \mathrm{D}_{\mathrm{e}}\right.$, Coulombs $\left./ \mathrm{mm}^{3}\right]\left[\mathrm{v}_{\mathrm{e}}, \mathrm{mm} / \mathrm{s}\right]\left[\mathrm{S}, \mathrm{mm}^{2}\right][\mathrm{dL}, \mathrm{m}]$

$$
\begin{equation*}
=\mathrm{n}_{\mathrm{e}} * \mathrm{e}^{*} *\left[\mathrm{v}_{\mathrm{e}}, \mathrm{~m} / \mathrm{s}\right] \tag{43}
\end{equation*}
$$

Here e is elementary charge (1.602 $1766208 \times 10^{-19}$ Coulomb), $D_{e}$ is density of electrons, $\mathrm{v}_{\mathrm{e}}$ is velocity of electrons, $S$ and dL are cross-section area and length of wire, $n_{e}$ is number of electrons in element of current.

For instance, density of copper is $8.932 \mathrm{~g} / \mathrm{cm}^{3}=8.932 \mathrm{mg} / \mathrm{mm}^{3}$. From molar mass of cupper, $63.546 \mathrm{~g} / \mathrm{mol}$ and Avogadro number, density of electrons in cupper is $\mathrm{D}_{\mathrm{e}}=(8.932$ $\left.\mathrm{mg} / \mathrm{mm}^{3} / 63546 \mathrm{mg} / \mathrm{mol}\right)^{*} 6.022045 * 10^{23} \mathrm{~mol}^{-1}=8.464562 * 10^{19}$ electrons $/ \mathrm{mm}^{3}$. Thus, charge density of electrons in cupper (as well as ions $\mathrm{Cu}^{+}$) is $\mathrm{e}^{*} \mathrm{D}_{\mathrm{e}}=13.5617$ Coulomb $/ \mathrm{mm}^{3}$.

From these estimates, velocity of electrons in cupper wires is:
$\mathrm{v}_{\mathrm{e}}, \mathrm{mm} / \mathrm{s}=[\mathrm{I}, \mathrm{A}] /\left\{\left[13.5617\right.\right.$ Coulombs $\left.\left./ \mathrm{mm}^{3}\right]\left[\mathrm{S}, \mathrm{mm}^{2}\right]\right\}$
For instance, at cross-section of wire $S=1 \mathrm{~mm}^{2}$, and electric current $\mathrm{I}=1 \mathrm{~A}$, velocity of electrons is only $0.073737 \mathrm{~mm} / \mathrm{s}$.

So on, differential Ampere law (Eq 38) may be rewritten as

$$
\begin{equation*}
\mathrm{F}, \mathrm{~N}=\left(1 / 10^{7}\right) *\left(\mathrm{n}_{1} * \mathrm{n}_{2}\right) \mathrm{e}^{2} *\left[\mathrm{v}_{\mathrm{e} 1}, \mathrm{~m} / \mathrm{s}\right]\left[\mathrm{v}_{\mathrm{e} 2}, \mathrm{~m} / \mathrm{s}\right] /[\mathrm{r}, \mathrm{~m}]^{2} \quad\left(\text { at } \mathrm{v}_{\mathrm{e} 1} \| \mathrm{v}_{\mathrm{e} 2} \perp_{\mathrm{r}}\right) \tag{45}
\end{equation*}
$$

Here $\mathrm{n}_{1}$ and $\mathrm{n}_{2}$ are numbers of electrons (= numbers of ions $\mathrm{Cu}^{+}$) in elements of electric currents, $\mathrm{v}_{\mathrm{e} 1}$ and $\mathrm{v}_{\mathrm{e} 2}$ are velocities of electrons in wires.

However there is a problem: if observer walks (together with system of coordinates) along wires with velocity $\mathrm{v}_{\mathrm{e} 1}$ or $\mathrm{v}_{\mathrm{e} 2}$, interaction force between wires should be observed at zero! This mystery is origin of numerous hypotheses, including Theory of Relativity.

However there is a simple way to solve this puzzle (Pivovarov, 2014). Indeed, Eq (45) may be rewritten as (also at $\mathrm{v}_{\mathrm{e} 1} \| \mathrm{v}_{\mathrm{e} 2} \perp \mathrm{r}$ ):
$\mathrm{F}\left(\mathrm{n}_{1} \mathrm{e}^{-}{ }_{1}\right.$ and $\left.\mathrm{n}_{2} \mathrm{e}^{-}{ }_{2}\right)=-\left(\mathrm{c}^{2} / 10^{7}\right)\left\{\mathrm{n}_{1} \mathrm{n}_{2} \mathrm{e}^{2} / \mathrm{r}^{2}\right\}\left[1+0.5\left\{\left(\mathrm{v}_{\mathrm{e} 1}-\mathrm{v}_{\mathrm{e} 2}\right)^{2} / \mathrm{c}^{2}\right\}\right]=$

$$
\begin{equation*}
=-\left(\mathrm{c}^{2} / 10^{7}\right)\left\{\mathrm{n}_{1} \mathrm{n}_{2} \mathrm{e}^{2} / \mathrm{r}^{2}\right\}\left[1+0.5\left\{\left(\mathrm{v}_{\mathrm{e} 1}-2 \mathrm{v}_{\mathrm{e} 1} \mathrm{~V}_{\mathrm{e} 2}+\mathrm{v}_{\mathrm{e} 2}{ }^{2}\right) / \mathrm{c}^{2}\right\}\right] \tag{46}
\end{equation*}
$$

$\mathrm{F}\left(\mathrm{n}_{1} \mathrm{e}^{-}{ }_{1}\right.$ and $\left.\mathrm{n}_{2} \mathrm{Cu}^{+}{ }_{2}\right)=+\left(\mathrm{c}^{2} / 10^{7}\right)\left\{\mathrm{n}_{1} \mathrm{n}_{2} \mathrm{e}^{2} / \mathrm{r}^{2}\right\}\left[1+0.5\left\{\left(\mathrm{v}_{\mathrm{e} 1}\right)^{2} / \mathrm{c}^{2}\right\}\right]$
$\mathrm{F}\left(\mathrm{n}_{1} \mathrm{Cu}^{+}{ }_{1}\right.$ and $\left.\mathrm{n}_{2} \mathrm{e}^{-}{ }_{2}\right)=+\left(\mathrm{c}^{2} / 10^{7}\right)\left\{\mathrm{n}_{1} \mathrm{n}_{2} \mathrm{e}^{2} / \mathrm{r}^{2}\right\}\left[1+0.5\left\{\left(\mathrm{v}_{\mathrm{e} 2}\right)^{2} / \mathrm{c}^{2}\right\}\right]$
$\mathrm{F}\left(\mathrm{n}_{1} \mathrm{Cu}^{+}{ }_{1}\right.$ and $\left.\mathrm{n}_{2} \mathrm{Cu}^{+}{ }_{2}\right)=-\left(\mathrm{c}^{2} / 10^{7}\right) \mathrm{n}_{1} \mathrm{n}_{2} \mathrm{e}^{2} / \mathrm{r}^{2}$
Thus, total tag between elements of currents is:
$\mathrm{F}_{\text {SUM }}=\left(1 / 10^{7}\right)\left\{\mathrm{n}_{1} \mathrm{n}_{2} \mathrm{e}^{2} / \mathrm{r}^{2}\right\}\left(\mathrm{v}_{\mathrm{e} 1} *_{\mathrm{e} 2}\right) \quad\left(\right.$ at $\left.\mathrm{v}_{\mathrm{e} 1} \| \mathrm{v}_{\mathrm{e} 2} \perp_{\mathrm{r}}\right)$
Here, $\left(\mathrm{v}_{\mathrm{e} 1}-\mathrm{v}_{\mathrm{e} 2}\right)$ is velocity of electron in $1^{\text {st }}$ wire relatively to electron in $2^{\text {nd }}$ wire, $\mathrm{v}_{\mathrm{e} 1}$ is velocity of electron in $1^{\text {st }}$ wire relatively to ion $\mathrm{Cu}^{+}$in $2^{\text {nd }}$ wire, and $\mathrm{v}_{2}$ is velocity of electron in $2^{\text {nd }}$ wire relatively to ion $\mathrm{Cu}^{+}$in $1^{\text {st }}$ wire. As may be seen, this theory of relativity needs no corrections on distortion of time and space.

So on, electromagnetic force between proton and electron at circular trajectory in atom of hydrogen is:

$$
\begin{array}{ll}
\mathrm{F}_{\mathrm{CM}}=\left(\mathrm{c}^{2} / 10^{7}\right)\left\{\mathrm{e}^{2} / \mathrm{r}^{2}\right\}\left[1+0.5\left\{\mathrm{v}^{2} / \mathrm{c}^{2}\right\}\right] & \text { or, may be } \\
\mathrm{F}_{\mathrm{CM}}=\left(\mathrm{c}^{2} / 10^{7}\right)\left\{\mathrm{e}^{2} / \mathrm{r}^{2}\right\}\left[1+\left\{\mathrm{v}^{2} / \mathrm{c}^{2}\right\}\right]^{0.5} & \text { or, may be } \\
\mathrm{F}_{\mathrm{CM}}=\left(\mathrm{c}^{2} / 10^{7}\right)\left\{\mathrm{e}^{2} / \mathrm{r}^{2}\right\} /\left[1-\left\{\mathrm{v}^{2} / \mathrm{c}^{2}\right\}\right]^{0.5} & \text { or etc } \tag{53}
\end{array}
$$

Here v is velocity of electron relatively to proton or, the same, velocity of proton relatively to electron, and $r$ is distance between electron and proton. Note here, that at circular orbit of electron, condition $\mathrm{v} \perp_{\mathrm{r}}$ is always satisfied. At $1^{\text {st }}$ level of hydrogen atom, velocity of electron is about $2188 \mathrm{~km} / \mathrm{s}$, and relation $0.5(\mathrm{v} / \mathrm{c})^{2} \approx 0.5 \alpha^{2} \approx 0.00002663$ is rather small. Because of this, all variants (Eqs 51,52,53) are almost identical in application to hydrogen atom. So, let as try most simple first variant (Eq. 51).

## BOHR MODEL WITH ROTATING PROTON AND MAGNET TAG AND FOGOTTEN BOHR FORMULA

At circular orbits of electron and proton, there is equality between centrifugal and electromagnetic forces:
$\mathrm{m}_{\mathrm{e}} \mathrm{v}_{\mathrm{e}}{ }^{2} / \mathrm{r}_{\mathrm{e}}=\mathrm{m}_{\mathrm{p}} \mathrm{v}_{\mathrm{p}}{ }^{2} / \mathrm{r}_{\mathrm{p}}=\left(\mathrm{c}^{2} / 10^{7}\right)\left\{\mathrm{e}^{2} /\left(\mathrm{r}_{\mathrm{e}}+\mathrm{r}_{\mathrm{p}}\right)^{2}\right\}\left[1+0.5\left\{\left(\mathrm{v}_{\mathrm{e}}+\mathrm{v}_{\mathrm{p}}\right)^{2} / \mathrm{c}^{2}\right\}\right]$
Appling $r_{e}=\left(r_{e}+r_{p}\right) /\left(1+m_{e} / m_{p}\right)$ and $r_{p}=\left(r_{e}+r_{p}\right) /\left(1+m_{p} / m_{e}\right)$, this relation may be reduced to:
$\left(1+\mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}\right) \mathrm{m}_{\mathrm{e}} \mathrm{v}_{\mathrm{e}}{ }^{2}=\left(1+\mathrm{m}_{\mathrm{p}} / \mathrm{m}_{\mathrm{e}}\right) \mathrm{m}_{\mathrm{p}} \mathrm{v}_{\mathrm{p}}{ }^{2}=\left(\mathrm{c}^{2} / 10^{7}\right)\left\{\mathrm{e}^{2} /\left(\mathrm{r}_{\mathrm{e}}+\mathrm{r}_{\mathrm{p}}\right)\right\}\left[1+0.5\left\{\left(\mathrm{v}_{\mathrm{e}}+\mathrm{v}_{\mathrm{p}}\right)^{2} / \mathrm{c}^{2}\right\}\right]$
Here $r_{e}+r_{p}$ is distance between electron and proton, $v_{e}+v_{p}$ is velocity of electron relatively to proton (or, the same, velocity of proton relatively to electron). So, orbital velocities of electron and proton at $1^{\text {st }}$ level are:
$\mathrm{v}_{\mathrm{e} 1}=\left[\left(\mathrm{c}^{2} / 10^{7}\right) \mathrm{e}^{2} / \hbar /\left(1+\mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}\right)\right]\left[1+0.5\left\{\left(\mathrm{v}_{\mathrm{e}}+\mathrm{v}_{\mathrm{p}}\right)^{2} / \mathrm{c}^{2}\right\}\right]=$

$$
\begin{equation*}
=[2186500.457349 \mathrm{~m} / \mathrm{s}] *\left[1+0.5\left\{\left(\mathrm{v}_{\mathrm{e}}+\mathrm{v}_{\mathrm{p}}\right)^{2} / \mathrm{c}^{2}\right\}\right] \tag{56}
\end{equation*}
$$

$\mathrm{v}_{\mathrm{p} 1}=\left[\left(\mathrm{c}^{2} / 10^{7}\right) \mathrm{e}^{2} / \hbar /\left(1+\mathrm{m}_{\mathrm{p}} / \mathrm{m}_{\mathrm{e}}\right)\right]\left[1+0.5\left\{\left(\mathrm{v}_{\mathrm{e}}+\mathrm{v}_{\mathrm{p}}\right)^{2} / \mathrm{c}^{2}\right\}\right]=\mathrm{v}_{\mathrm{e} 1} \mathrm{~m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}$
Solving these relations iteratively, one may obtain velocities of electron and proton at $1^{\text {st }}$ level:
$\mathrm{v}_{\mathrm{e} 1}=2186558.677505 \ldots \mathrm{~m} / \mathrm{s}$
$\mathrm{v}_{\mathrm{pl}}=1190.837074 \ldots \mathrm{~m} / \mathrm{s}$
Velocity of electron relatively to proton (or, velocity of proton with respect to electron) at $1^{\text {st }}$ level is (see Fig 1):
$\mathrm{v}_{\mathrm{e} 1}+\mathrm{v}_{\mathrm{p} 1}=\mathrm{v}_{\mathrm{e} 1}\left(1+\mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}\right)=2187749.514579 \ldots \mathrm{~m} / \mathrm{s}$
Distance between electron and proton at $1^{\text {st }}$ level is
$\left(\mathrm{r}_{\mathrm{e} 1}+\mathrm{r}_{\mathrm{p} 1}\right)=\hbar / \mathrm{m}_{\mathrm{e}} \mathrm{V}_{\mathrm{e} 1}=\hbar / \mathrm{m}_{\mathrm{p}} \mathrm{v}_{\mathrm{p} 1}=0.529451311729572 \ldots \AA$
Radii of electron and proton orbits at $1^{\text {st }}$ level:
$r_{e l}=\left(r_{e 1}+r_{p l}\right) /\left(1+m_{e} / m_{p}\right)=0.529163120487063 \ldots \AA$
$\mathrm{r}_{\mathrm{p} 1}=\left(\mathrm{r}_{\mathrm{e} 1}+\mathrm{r}_{\mathrm{p} 1}\right) /\left(1+\mathrm{m}_{\mathrm{p}} / \mathrm{m}_{\mathrm{e}}\right)=\mathrm{r}_{\mathrm{e} 1} \mathrm{~m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}=0.000288191242509 \ldots \AA$
Similarly, velocities of electron and proton at level $n$ may be calculated from:
$\mathrm{v}_{\mathrm{en}}=(1 / \mathrm{n})[2186500.457349 \mathrm{~m} / \mathrm{s}]^{*}\left[1+0.5\left\{\left(\mathrm{v}_{\mathrm{en}}+\mathrm{v}_{\mathrm{pn}}\right)^{2} / \mathrm{c}^{2}\right\}\right]$
$\mathrm{v}_{\mathrm{pn}}=\mathrm{v}_{\mathrm{en}} \mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}$
Kinetic energies of electron and proton at $1^{\text {st }}$ level may be calculated from:
$E_{\text {ekin }}(n=1)=m_{e} V_{e}{ }^{2} / 2=2.177615762768852 * 10^{-18} J$
$\mathrm{E}_{\mathrm{pkin}}(\mathrm{n}=1)=\mathrm{m}_{\mathrm{p}} \mathrm{v}_{\mathrm{p}}{ }^{2} / 2=\mathrm{E}_{\text {ekin }} \mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}=0.001859666104505 * 10^{-18} \mathrm{~J}$
Total kinetic energy at $1^{\text {st }}$ level is:
$\mathrm{E}_{\text {kin }}(\mathrm{n}=1)=\mathrm{E}_{\text {ekin }}+\mathrm{E}_{\mathrm{pkin}}=\mathrm{E}_{\text {ekin }}\left(1+\mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}\right)=2.1788018017 \ldots * 10^{-18} \mathrm{~J}$
Kinetic energy at others levels may be calculated from:
$\mathrm{E}_{\mathrm{kin}}(\mathrm{n})=0.5 \mathrm{~m}_{\mathrm{e}} \mathrm{V}_{\mathrm{en}}{ }^{2}\left[1+\mathrm{m}_{\mathrm{e}} / \mathrm{m}_{\mathrm{p}}\right]$
Coulombic Energy at $1^{\text {st }}$ level is:
$\mathrm{E}_{\text {Coulomb }}(\mathrm{n}=1)=\left(\mathrm{c}^{2} / 10^{7}\right)\left\{\mathrm{e}^{2} /\left(\mathrm{r}_{\mathrm{e}}+\mathrm{r}_{\mathrm{p}}\right)\right\}=\left(\mathrm{c}^{2} / 10^{7}\right)\left\{\mathrm{m}_{\mathrm{e}} \mathrm{v}_{\mathrm{e} 1} \mathrm{e}^{2} / \hbar\right\}=4.3574875762 \ldots * 10^{-18} \mathrm{~J}$
$\mathrm{E}_{\text {Coulomb }}(\mathrm{n})=\left(\mathrm{c}^{2} / 10^{7}\right)\left\{\mathrm{m}_{\mathrm{e}} \mathrm{V}_{\mathrm{en}} \mathrm{e}^{2} / \mathrm{n} \hbar\right\}$
Magnet tag is defined by:
$\mathrm{F}_{\text {Magnet }}(\mathrm{n}=1)=\left(0.5 / 10^{7}\right) \mathrm{e}^{2}\left(\mathrm{v}_{\mathrm{el} 1}+\mathrm{v}_{\mathrm{p} 1}\right)^{2} /\left(\mathrm{r}_{\mathrm{e} 1}+\mathrm{r}_{\mathrm{pl}}\right)^{2}=\left(0.5 / 10^{7}\right)\left\{\mathrm{e}^{2}\left(\mathrm{v}_{\mathrm{e} 1}+\mathrm{v}_{\mathrm{pl}}\right)^{2}\left(\mathrm{v}_{\mathrm{e} 1} \mathrm{~m}_{\mathrm{e}} / \hbar\right)^{2}\right\}$
$\mathrm{F}_{\text {Magnet }}(\mathrm{n}=2) \approx\left(0.5 / 10^{7}\right) \mathrm{e}^{2}\left(0.5 \mathrm{v}_{\mathrm{e} 1}+0.5 \mathrm{v}_{\mathrm{pl}}\right)^{2} /\left(4 \mathrm{r}_{\mathrm{e} 1}+4 \mathrm{r}_{\mathrm{p} 1}\right)^{2}=\left(0.5 / 10^{7}\right)\left\{\mathrm{e}^{2}\left(\mathrm{v}_{\mathrm{e} 1}+\mathrm{v}_{\mathrm{pl}}\right)^{2} /\left(\mathrm{r}_{\mathrm{e} 1}+\mathrm{r}_{\mathrm{p} 1}\right)^{2}\right\} / 2^{6}$
$\mathrm{F}_{\text {Magnet }}(\mathrm{n}=3) \approx\left(0.5 / 10^{7}\right) \mathrm{e}^{2}\left(\mathrm{v}_{\mathrm{e} 1} / 3+\mathrm{v}_{\mathrm{p} 1} / 3\right)^{2} /\left(9 \mathrm{r}_{\mathrm{e} 1}+9 \mathrm{r}_{\mathrm{p} 1}\right)^{2}=\left(0.5 / 10^{7}\right)\left\{\mathrm{e}^{2}\left(\mathrm{v}_{\mathrm{e} 1}+\mathrm{v}_{\mathrm{p} 1}\right)^{2} /\left(\mathrm{r}_{\mathrm{e} 1}+\mathrm{r}_{\mathrm{p} 1}\right)^{2}\right\} / 3^{6}$
As may be seen, Magnet tag drops as $1 / \mathrm{n}^{6}$, or as $1 /\left(\mathrm{r}_{\mathrm{e}}+\mathrm{r}_{\mathrm{p}}\right)^{3}$. Integer of $1 / \mathrm{x}^{3}$ is $-0.5 / \mathrm{x}^{2}$. Thus, hypothetical "Magnet energy" drops as $1 / \mathrm{n}^{4}$ or $1 / \mathrm{r}^{2}$ and may be guessed from:
$\mathrm{E}_{\mathrm{Mn}}=\left(0.25 / 10^{7}\right)\left\{\mathrm{e}^{2}\left(\mathrm{v}_{\mathrm{en}}+\mathrm{v}_{\mathrm{pn}}\right)^{2}\right\} /\left(\mathrm{r}_{\mathrm{en}}+\mathrm{r}_{\mathrm{pn}}\right)=\left(0.25 / 10^{7}\right)\left\{\mathrm{e}^{2}\left(\mathrm{v}_{\mathrm{en}}+\mathrm{v}_{\mathrm{pn}}\right)^{2}\right\} \mathrm{v}_{\mathrm{en}} \mathrm{m}_{\mathrm{e}} /(\mathrm{n} \hbar) \sim \mathrm{E}_{\mathrm{M} 1} / \mathrm{n}^{4}$
"Magnet energy" at $1^{\text {st }}$ level is:

$$
\begin{gather*}
\mathrm{E}_{\mathrm{M} 1}=\left(0.25 / 10^{7}\right)\left\{\mathrm{e}^{2}\left(\mathrm{v}_{\mathrm{e} 1}+\mathrm{v}_{\mathrm{p} 1}\right)^{2}\right\} /\left(\mathrm{r}_{\mathrm{e} 1}+\mathrm{r}_{\mathrm{pl} 1}\right)=\left(0.25 / 10^{7}\right)\left\{\mathrm{e}^{2}\left(\mathrm{v}_{\mathrm{e} 1}+\mathrm{v}_{\mathrm{pl} 1}\right)^{2}\right\} \mathrm{v}_{\mathrm{e} 1} \mathrm{~m}_{\mathrm{e}} / \hbar= \\
=0.0000500136 \ldots * 10^{-18} \mathrm{~J} \tag{76}
\end{gather*}
$$

Thus binding energy at $1^{\text {st }}$ level is:
$\mathrm{E} 1=\mathrm{E}_{\mathrm{C} 1}+\mathrm{E}_{\mathrm{M} 1}-\mathrm{E}_{\mathrm{kin} 1}=2.1787437881 \ldots * 10^{-18} \mathrm{~J}$
$\lambda(1-\infty)=\mathrm{hc} / \mathrm{E} 1=911.7390649676533 \ldots \AA$
Close approximation to present model (exact within 8 digits) is "formula, suggested by Dr. Bohr in letter to Prof. Fowler" (citation from Curtis, 1914, with parameter "k" instead $0.5 \alpha^{2}$ ):

$$
\begin{align*}
& \lambda\left(\mathrm{n}_{1}-\mathrm{n}_{2}\right)=1 / \mathrm{R}_{\mathrm{H}} /\left(1 / \mathrm{n}_{1}^{2}-1 / \mathrm{n}_{2}^{2}\right) /\left\{1+0.5 \alpha^{2}\left(1 / \mathrm{n}_{1}{ }^{2}+1 / \mathrm{n}_{2}^{2}\right)\right\}= \\
&=[911.76334193052 \ldots \AA] /\left\{1 / \mathrm{n}_{1}^{2}-1 / \mathrm{n}_{2}^{2}{ }^{2}+0.5 \alpha^{2}\left(1 / \mathrm{n}_{1}^{4}-1 / \mathrm{n}_{2}^{4}\right)\right\} \tag{79}
\end{align*}
$$

$\lambda(n-\infty)=[911.76334193052 \ldots \AA] /\left(1 / n^{2}+0.5 \alpha^{2} / n^{4}\right)$

Here $911.76334193052 \ldots \AA=1 / R_{H}$ is reversed Rydberg constant for hydrogen, $\alpha=\left\{c / 10^{7}\right\} \mathrm{e}^{2} / \hbar$ $=1 / 137.03599914 \ldots$ is fine structure constant.

Original Bohr letter (15 April 1914) with parameter $\pi^{2} e^{4} / h^{2} c^{2}$ (CGSE units: e $\sim 4.8 * 10^{-10}$ electric units; $\mathrm{h} \sim 6.6^{*} 10^{-27} \mathrm{erg}$ s; c $\sim 3 * 10^{10} \mathrm{~cm} / \mathrm{s}$ ) $=\pi^{2} \mathrm{c}^{2} \mathrm{e}^{4} / 10^{14} \mathrm{~h}^{2}($ in SI units, see Tab 1 ) $=$ $0.25 \alpha^{2}$ instead $0.5 \alpha^{2}$ in Eq 79, may be found in Hoyer (1981). In response to Bohr (20 April 1914), Prof Fowler reported experimental estimations for this parameter, 0.00003 to 0.00004 , which is closer to $0.5 \alpha^{2}=0.000026625677 \ldots$, as guessed in present study from Ampere law.

It should be noted that Eq (79) was deduced by Bohr from mass defect. However, this was just a commentary. So, let us deduce Eq (79) from mass defect. Taking binding energy from Eq (36), $\mathrm{E}_{\mathrm{n}}=\operatorname{chR}_{\mathrm{H}} / \mathrm{n}^{2}=\left[2.178685776 * 10^{-18} \mathrm{~J}\right] / \mathrm{n}^{2}$, mass defect is $\Delta \mathrm{m}_{\mathrm{n}}=\mathrm{E}_{\mathrm{n}} / \mathrm{c}^{2}=$ $\left[2.424114851 * 10^{-35} \mathrm{~kg}\right] / \mathrm{n}^{2}$. Thus, assuming that this is mass defect of electron, kinetic energy should be slightly reduced, and thus, binding energy should slightly enlarged by $\Delta \mathrm{m}_{\mathrm{n}} \mathrm{v}_{\mathrm{en}}{ }^{2} / 2=$ $0.5 \mathrm{E}_{\mathrm{n}} \mathrm{v}_{\mathrm{en}} 2 / \mathrm{c}^{2}=0.5 \mathrm{E}_{\mathrm{n} 1}\left(\mathrm{v}_{\mathrm{en} 1} / \mathrm{c}\right)^{2} / \mathrm{n}^{4}=0.5 \mathrm{E}_{n 1} \alpha^{2} / \mathrm{n}^{4}$. Thus, dissociation lines may be calculated as $\lambda(\mathrm{n}-\infty)=\mathrm{ch} /\left(\mathrm{E}_{\mathrm{n} 1} / \mathrm{n}^{2}+0.5 \mathrm{E}_{\mathrm{n} 1} \alpha^{2} / \mathrm{n}^{4}\right)=\mathrm{Eq}(80)$. Transition lines may be calculated as $\lambda\left(\mathrm{n}_{1}-\mathrm{n}_{2}\right)=$ $1 /\left(1 / \lambda_{\mathrm{nl}-\infty}-1 / \lambda_{\mathrm{n} 2-\infty}\right)=$ Eq. (79). As may be seen, both models, originating from mystical Ampere law give the same result. So, may be, mass defect arises dew to magnet force.

Fig. 3 Vacuum wavelengths of hydrogen Lyman series ( $\AA$ ) and deviation (right panel) from Bohr model with rotating proton Eq (39). Black points: "critical compilation of experimental data" (Kramida 2010); crosses: lines from 3 independent Solar spectra from Parenti et al (2005). Solid curve is Bohr model with rotating proton and magnet tag (Eq. 79).

Fig. 4 Vacuum wavelengths of hydrogen Balmer series ( $\AA$ ) and deviation (right panel) from Bohr model with rotating proton Eq (39). Black points: "critical compilation of experimental data" (Kramida 2010). Solid curve is Bohr model with rotating proton and magnet tag (Eq. 79).

However, additional binding energy causes additional mass defect, which also contributes into binding energy and closer approximation to "magnet model" (exact within 12 digits) is:
$\lambda\left(\mathrm{n}_{1}-\mathrm{n}_{2}\right)=[911.76334193052 \AA] /\left\{1 / \mathrm{n}_{1}{ }^{2}-1 / \mathrm{n}_{2}{ }^{2}+0.5 \alpha^{2}\left(1 / \mathrm{n}_{1}{ }^{4}-1 / \mathrm{n}_{2}{ }^{4}\right)+0.5 \alpha^{4}\left(1 / \mathrm{n}_{1}{ }^{6}-1 / \mathrm{n}_{2}{ }^{6}\right)\right\}$
$\lambda(\mathrm{n}-\infty)=[911.76334193052 \AA] /\left\{1 / \mathrm{n}^{2}+0.5 \alpha^{2} / \mathrm{n}^{4}+0.5 \alpha^{4} / \mathrm{n}^{6}\right\}$
Calculated wavelengths given in Tabs. 3 and 4. It should be noted, that difference between Eqs (79) and exact solution is almost negligible: $0.000002262 \AA$ at transition 1-2 and $0.000001293 \AA$ at transition $1-\infty$ (Lyman series); $0.0000009552 \AA$ at transition 2-3, and $0.0000003232 \AA$ at transition $2-\infty$ (Balmer series), etc. So, there seems no significant sense in Eq. (81). Nevertheless, Eq.(81) was applied here to reproduce $6^{\text {th }}$ sign after comma in Tabs 3-5.

Fig. 3 (right) shows the difference between Lyman wavelengths of Bohr model with rotation of proton (Eq. 39) and experimental data (Parenti et al, 2005; Kramida, 2010). As may be seen, large and wide Lyman lines (up to $n_{2}=9$ ) seems to be equally consistent with both model (Eq. 39 or 79 ). However, small and fine lines $\left(\mathrm{n}_{2}=10 \div 22\right)$ seems to be consistent with Eq (79). As may be seen in Fig. 4 (right), Eq. (79) is well consistent with Balmer series data.

## AIR SPECTRA

It should be also noted that observer fill bad in vacuum, and most of data were measured at atmospheric conditions (except Lyman series, because of aggressive behavior of oxygen in this spectral diapason). Speed of light in atmospheric air is smaller by $\sim 83 \mathrm{~km} / \mathrm{s}$. In result, wavelengths also become shorter:

$$
\begin{equation*}
\lambda_{\mathrm{Air}}=\mathrm{c}_{\mathrm{Air}} / v=\lambda_{\mathrm{vad}} / \mathrm{n}_{\mathrm{Air}} \tag{83}
\end{equation*}
$$

Here $\mathrm{n}_{\text {Air }}=\mathrm{c} / \mathrm{c}_{\text {Air }}$ is refractive index of air ( $\sim 1.000277$ ). In accordance with Ciddor (1996), refractive index of dry air with 450 ppm CO 2 may be calculated from:
$\mathrm{n}_{\text {Air }}=1+\mathrm{f}\left\{0.05792105 /\left(238.0185-1 /\left[\lambda_{\text {vac }}, \mu \mathrm{m}\right]^{2}\right)+0.00167917 /\left(57.362-1 /\left[\lambda_{\text {vac }}, \mu \mathrm{m}\right]^{2}\right)\right\}$
Here $\mathrm{f}=\mathrm{q}[\mathrm{P}, \mathrm{Atm}] * 288.15 /\left(\mathrm{t}^{\circ} \mathrm{C}+273.15\right)$, q is correction on humidity and $\mathrm{CO}_{2}$ content (here, $\mathrm{q}=$ 1: see Ciddor, 1996, for details). Note here that $\mathrm{t}^{\circ} \mathrm{C}$, and P , Atm are temperature and pressure of air between prism (or grating) and detector, or inside of monochromator.

In Tab. 5, experimental wavelengths of hydrogen Balmer series, measured in air (Curtis, 1914, Wood, 1922, Perepelitsa and Pepper, 2006) are compared with Bohr model with rotation of proton and magnet tag, adjusted to air pressure 1 Atm and various temperatures $0,15,30^{\circ} \mathrm{C}$.

As may be seen in Fig 6, wavelengths of Balmer series lines in air are 1-2 $\AA$ smaller then in vacuum, whereas observers prefer ambient temperature $+15^{\circ} \mathrm{C}$ and 1 Atm , or, may be, $+20^{\circ} \mathrm{C}$ at pressure 1.01735 Atm .

Fig. 5 Difference between Balmer wavelengths, measured in air and vacuum (Eq. 79; left) and (right) difference between data measured in air and $\mathrm{Eq}(79) / \mathrm{Eq}(84)$ at $15^{\circ} \mathrm{C}$ and 1 Atm . Solid curve: $15^{\circ} \mathrm{C}, 1$ Atm (or, $20^{\circ} \mathrm{C}$ and 1.01735 Atm ). Dashed curves: various temperatures and 1 Atm. Points: data from Wood, 1922, cubes: Curtis, 1914, crosses: Perepelitsa and Pepper, 2006.

(a): temperature of air between prism (or grating) and detector, or inside of monochromator. (nr): not reported

## CONCLUDING REMARKS

With help of Archimedes and Ampere, was obtained forgotten formula of Bohr, suggested in letter to Fowler at 15 April 1914, and deduced from mass defect. It appears to be, that this formula is consistent with experimental wavelengths of hydrogen atom spectral lines.
